

WHAT ARE THE BENEFITS OF A TOPOGRAPHIC SURVEY?

- The overall benefit is the proactive knowledge of your site with regards to environmental risks. You are able to identify many issues prior to unforeseen circumstances such as spillages etc. Using the information at hand you can control the risk to the environment and eliminate prosecutions and costly fines.
- In emergency situations you are able to quickly identify things such as isolation valves or manholes. Many clients use a number tagging system to identify valves, manholes etc., in relation to the drawing highlighting the location of such equipment.
- You are able to manage the maintenance of your equipment and have a clear understanding of the site layout. Fire hydrants, interceptor tanks and other related equipment are all easily identified, a simple database used in conjunction with the Topographic plan, is usually an adequate tool to identify routine maintenance schedules.
- Any site developments can be carefully planned, eliminating the risk of disruption to other areas of the site. The survey can also be used to reduce the risk of costly damage to underground apparatus, in such areas where excavations are required.
- A topographic survey detailing the sites utilities and drainage layout is an essential tool in the ISO 14001 accreditation.
